

Dizzion on Nutanix Cloud Infrastructure is Desktop as a Service made truly simple

Key Benefits

Dizzion helps deliver end-to-end solutions for virtual apps and desktops and provides three critical benefits:

- Deliver an intuitive and premium user experience from a browser.
- Enterprise capabilities without the enterprise complexity.
- Integrate seamlessly with Nutanix AOS and AHV.

[Take a Test Drive](#)

Dizzion's Frame platform combined with **Nutanix Cloud Infrastructure** delivers one of the most streamlined **Desktop as a Service (DaaS)** solutions for enterprise environments. Designed to be simple for users and administrators, Frame delivers a premium user experience directly from a web browser. No installations, no hassle.

Administrators enjoy enterprise features, without enterprise complexity through innovative design, full-stack development and powerful automation via Frame API. Frame is also able to take full advantage of Nutanix key **end-user computing** capabilities, including rapid VM provisioning, powerful GPU virtualization and integrated network **microsegmentation**.

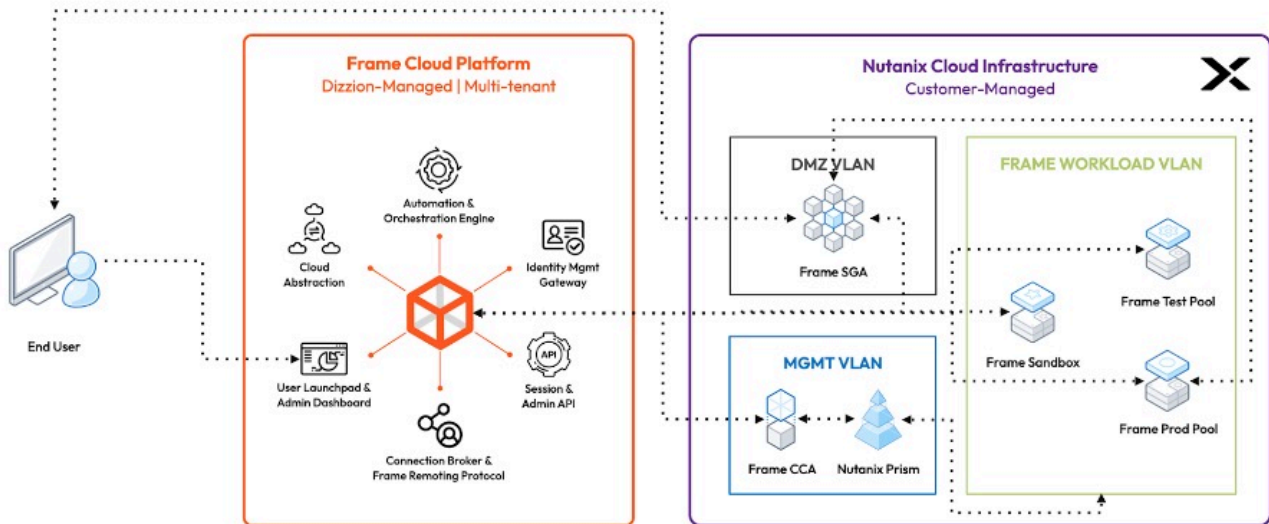

The more we spoke to other customers and tried it out for ourselves the more we came to see Frame as a perfect fit for this particular cohort of remote users. No need for client software – just a browser – no plug-ins or infrastructure changes and everything managed through a single console instead of six or seven as with our existing EUC platform. It was staggering how little effort was needed.

Timon Watson,
End-User Computing Team Leader, Robert
Gordon University

How it works

Frame integrates seamlessly with **Nutanix AHV** deployments. Simply add your AHV cluster as a Frame cloud account by deploying a Frame Cloud Connector Appliance (CCA) from **Nutanix Prism** Central. Frame's control plane is then able to orchestrate the environment through Nutanix Prism Element and Prism Central APIs via the CCA.

Turn your existing Windows or Linux VM into a Frame BYO Template Image by running the Frame Agent Setup Tool on the VM. Customers can also deploy Frame Streaming Gateway Appliances (SGA) within their network DMZ – serving as the WebRTC TURN server to facilitate secure, external access to Frame workload VMs via the Frame Remoting Protocol (FRP).
